Keywords: *Amorphophallus*, Cibodas Botanic Garden, Conservation, *ex situ*

Some efforts in *ex situ* conservation of *Amorphophallus* have been conducted in Cibodas Botanic Garden, Indonesia. *Amorphophallus titanum* was collected in Cibodas Botanic Garden for the first time in the year 2000. The plant was brought from Batang Suliti, Solok Regency, from a location in Mount Kerinci Seblat National Park, Sumatra. This plant has grown and developed very well including growth of a seedling, which was obtained from the infructescence of the mother plant. The long history of this single plant is continuing to the present with a 7-time record of inflorescence development since 2003. In order to increase the number of individual plants, some artificial pollination was conducted on *A. titanum*, which resulted in hundreds of seedlings. The enrichment of the living collection with some species other than *Amorphophallus titanum* was also planned and an extended site in the garden has already been prepared. We also collected and maintain some other species of *Amorphophallus* in the nursery to be planted in the garden, such as *A. asper*, *A. decus-silvae*, *A. manta*, *A. spectabilis*, etc.
